1. Convert Celsius to Fahrenheit.
2. Convert kilometers to miles.
3. Find the square and cube of a number.
4. Check whether a character is a vowel or consonant.
5. Check if a number is positive, negative, or zero.
6. Check whether a number is divisible by both 5 and 11.
7. Check if a string is a palindrome.
8. Count words in a sentence.
9. Count frequency of each character
10. Find the longest word in a sentence
11. Find common elements between two lists.
12. Rotate a list by N positions.
13. Find keys with maximum value.
14. Find difference between two sets.
15. Sort a dictionary by values.
16. Create a function to check prime numbers.
17. Copy contents from one file to another
18. A Student Management System is a software application used to maintain student information such as roll number, name, course, marks, attendance, and other academic records. It allows users to perform operations like adding, updating, searching, displaying, and deleting student records. This practical demonstrates the use of Object-Oriented Programming (OOP), file handling, and data management in Python.
19. A Library Management System is an application that manages books, members, and borrowing transactions. It helps librarians issue books, return books, search for books, and maintain library records. This practical introduces database/file management along with OOP concepts.
20. A **Bank Management System** is a software application used to manage customer accounts and banking transactions. It allows users to create accounts, deposit and withdraw money, transfer funds, and check account balances securely.
21. A **Number System Conversion Program** is a Python program used to convert numbers from one number system to another, such as binary, decimal, octal, and hexadecimal.
22. Write a Python program to create a two-dimensional array of size 3 × 4 and display its shape and dimensions.
23. Write a program to flatten a two-dimensional array into a one-dimensional array.
24. Write a Python program to insert an element at a specified position in an array.
25. Write a program to split a NumPy array into equal parts.
26. Write a program to extract alternate elements from a NumPy array.
27. Write a Python program to replace all even numbers in an array with zero.
28. Write a Python program to calculate the average (mean) of array elements.

29. **.** Write a Python program to calculate the transpose of a matrix.
30. Write a Python program to shuffle the elements of an array.
31. Write a Python program to generate a random password using NumPy.
32. Write a Python program to replace missing (NaN) values with the mean of the array.
33. Write a Tkinter program to develop a Tic-Tac-Toe game for two players.
34. Write a Tkinter program to develop a Number Puzzle game for two players.
35. Write a Python program to find students who scored more than 80 marks using Pandas.
36. Write a Python program to remove duplicate records from a DataFrame.
37. Write a Python program to replace missing values with zero.
38. Write a Python program to find the mean, median, and mode of DataFrame columns.
39. A **Contact Book Application** is a Python-based GUI project developed using **Tkinter and Database (SQLite/MySQL)** to store and manage contact information. It allows users to add, search, delete contact details such as name, phone number, email address, and address through an easy-to-use graphical interface. The database is used for permanent storage of contact records, while Tkinter provides the user interface for interaction.
40.
